SUMMARY

CSE undergraduate at United International University (graduating 2027). Most of my project work is backend development in C# and ASP.NET Core with PostgreSQL: REST APIs, JWT login with role checks, EF Core data models, and order and account logic. I have also built the React frontends that call these APIs.

TECHNICAL SKILLS

Languages	C#, SQL, JavaScript, C++, Java, Python
Backend	ASP.NET Core Web API (.NET 8 and 10), Entity Framework Core, REST APIs, JWT authentication, role-based authorization, SignalR, background services
Databases	PostgreSQL, relational schema design, EF Core code-first migrations, SQL queries
Testing and tools	xUnit with EF Core InMemory, Swagger and .http request files for manual API testing, Git and GitHub, Docker (basic)
Frontend	React, Axios (used to connect my APIs to a UI)

PROJECTS

rag-kit – multi-tenant document Q&A app (backend API) github.com/shamiulriyad/rag-kit

ASP.NET Core (.NET 10), EF Core, PostgreSQL, JWT, xUnit. The AI search runs in a separate Python service; the work below is the C# API.

- Built the API for users, workspaces and knowledge bases, with Owner, Admin and Member roles per workspace. One authorization service loads each resource and returns 404 to non-members, so users cannot see another workspace's data.
- Implemented JWT login with refresh tokens that rotate on every refresh. Reusing an old or revoked token signs the user out of all sessions. Password reset and email verification use single-use tokens that are stored only as hashes.
- Added plan limits (knowledge bases, documents, storage, monthly questions), support tickets and activity logs, and wrote 40 xUnit tests for the access rules, token flows and limit checks.

Avenzaq – multi-vendor e-commerce backend github.com/shamiulriyad/Avenzaq

ASP.NET Core (.NET 10), EF Core, PostgreSQL, JWT, SignalR, React

- Wrote checkout as one database transaction: the cart is split into a sub-order per seller with that seller's commission and net amount, stock is reduced per product or variant, and the whole order rolls back if any item is out of stock.
- Protected Customer, Seller and Admin endpoints with JWT role checks. A seller needs admin approval before managing orders and can only change the status of their own sub-orders.
- Saved order notifications (placed, confirmed, shipped, delivered) in PostgreSQL with paging and unread counts, and pushed them to each user through a SignalR hub.

E-Learning Platform API – university course and competition platform github.com/shamiulriyad/DatabaseHub

ASP.NET Core 8, EF Core, PostgreSQL, JWT, SignalR, React. Team project; I built the backend.

- Designed a 48-table PostgreSQL schema (universities, departments, courses, enrollments, assignments, competitions) with EF Core code-first, using foreign keys, unique indexes and delete rules, and changed it through migrations.
- Built 24 REST controllers with JWT authentication, Student, Teacher and Admin role checks, and BCrypt password hashing.
- Wrote a background service that moves competitions from Upcoming to Ongoing to Completed on schedule, and used SignalR to push course and community updates.

EDUCATION

BSc in Computer Science and Engineering, United International University (UIU), Dhaka 2023 – 2027 (expected)

ACHIEVEMENTS

- 2nd runner-up, UIU CSE Project Show (March 2026), with the E-Learning platform above.
- Took part in 7 hackathons in 2026. Our team placed in the top 70 of 700+ teams at Infinity AI BuildFest.
- Solved 575+ problems on Codeforces, CodeChef and LeetCode.
